

THICKNESS DETERMINES THE LIFE AND DURABILITY OF YOUR FLOOR.

It goes without saying that floors subject to heavy impact require durable topping systems. Nuplex promote 8mm thick floor toppings against thinner section (seemingly as durable coating systems) as we believe that clients will find significant benefits in thicker section flooring.

We believe it is false economy to paint a floor when a topping is required, a scrape or hard impact will damage a coating system resulting in premature wear and early maintenance.

A heavy duty industrial screed (eg 9mm vs 3mm) may be surface damaged but the effectiveness of the floor will remain intact.

We offer these images as an explanation of the mode of failure in thin section floor toppings.

Heavy Duty Floor Topping has surface indent but is still structurally sound

Thin Film Topping shows damage through to the substrate resulting in early failure or premature wear
